ONE MELODY, ONE MAP

Listen. Look. Compare.

A short guide to trying FIRULET MAP 0.3.3 and telling us what helps you.

What does it do?

It analyzes a guitar recording and estimates notes and their timing, a pitch curve and probable bends. You can then compare the map with the original audio.

The goal of this test

We want to know whether you can get started without help and whether the map helps you work out a melody. We do not expect perfect transcription: errors are useful feedback too.

Prepare a supported recording

Isolated guitar, one note at a time, with distortion. Mono or stereo PCM16, PCM24 or float32 WAV at 44.1 or 48 kHz, up to 40 seconds. The app prepares a compatible copy without changing the original. No BPM, meter or DI required.

Not included in this version

No chord detection or instrument separation. MIDI export and a local synth are included, but note editing, saved analyses and a configurable musical grid are not yet available. Detection is still a proposal to review.

Your path: open the app > analyze > explore the map > send feedback.

01 / GETTING STARTED

Choose how to use it

Two downloads for Windows x64. Both analyze offline; the app is in English.

Portable: extract and open

Download FiruletMap-0.3.3-win-x64.zip. Extract everything to a writable folder and run FiruletMap.App.exe. Keep the DLLs and subfolders. Private .NET and Python are included; no installation or administrator permission is needed.

Installer: run setup

Download FiruletMap-0.3.3-win-x64-installer.zip. Extract it and run FiruletMap-0.3.3-win-x64-setup.exe. Administrator permission is required. It installs for all users and adds Start menu shortcuts. The desktop shortcut is optional.

Installer dependencies

It reuses a compatible .NET 10 Desktop Runtime x64 or installs the included Microsoft package if needed. Python stays private to FIRULET MAP. Installation and analysis need no internet. Windows 11 is the tested system; Windows x64 is required.

Update or uninstall

Close the app before running a newer installer. Updating is manual; there is no automatic updater. Uninstall from Windows Installed apps. Personal files and shared .NET are preserved. An older portable copy remains in its own folder.

If Windows blocks startup

The app and its installer do not have their own digital signature. Record the message and contact the distributor; do not disable your computer protection. Keep the exact text of any installation error for feedback.

02 / ANALYZE

See what is happening

You will see Stage X of 5, the stage name, an animation and elapsed time. This is not a percentage or an estimate of remaining time.

1. Open your audio

The header must show Version 0.3.3. Choose your recording with Open WAV: analysis starts automatically. Use Analyze to run it again. No test recordings are distributed.

2. Follow the five stages

Preparing audio and local runtime > Estimating pitch and audio features > Segmenting notes > Detecting probable bends > Preparing the note map. These are real pipeline boundaries; the final stages may pass very quickly.

3. One stage may take longer

Initial preparation and pitch estimation may account for most of the wait. The animation and timer remain active. The first run may take longer than later runs; stage 2 of 5 does not mean 40% of the time.

4. Play or cancel

You can play audio while analysis runs. Cancel analysis stops the process; audio stays available and the progress panel disappears. Click Analyze again to start over.

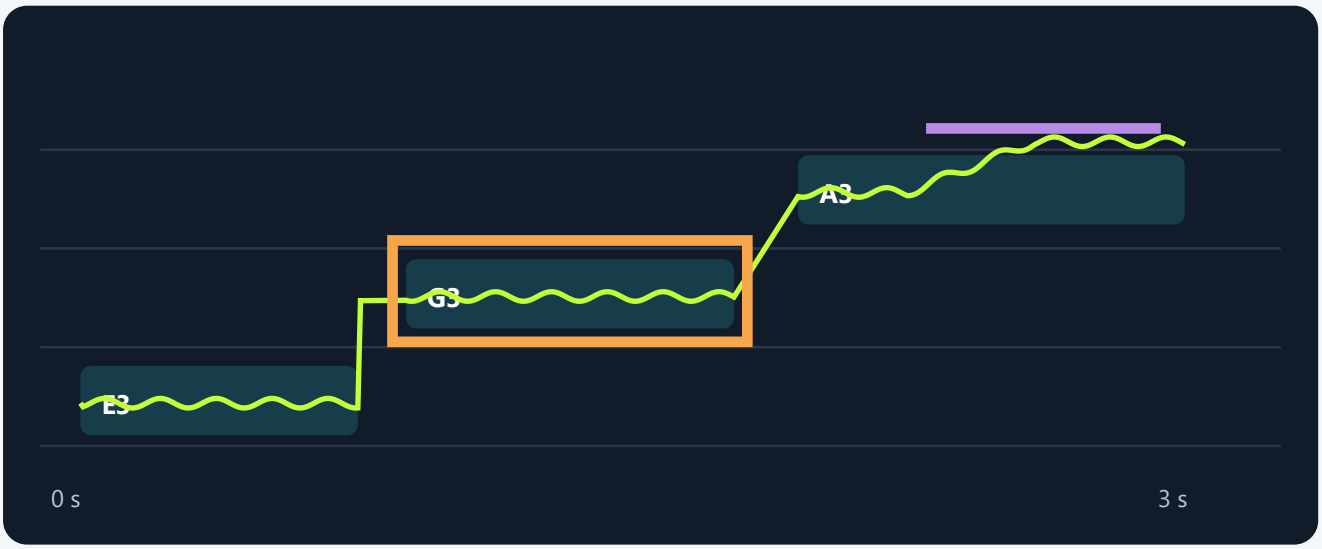

5. Review and compare

The result shows waveform, notes, pitch curve, probable bends and uncertain areas. Version 0.3.3 improves repetitions and legato with local sensitivity; fast low notes and tapping can still fail. Stages are not percentages.

03 / READING THE RESULT

Your note map

The horizontal axis shows seconds; higher-pitched notes appear higher up.

Illustrative diagram; not a screenshot or a measured result.

Blue: note

Each block represents an estimated note and its time interval. The table shows Note, Start (s), End (s) and Review.

Lime: pitch curve

The curve shows changes in detected pitch; each oscillation does not represent a new note.

Purple and orange: review

Purple indicates a probable bend. Orange marks uncertainty. Listen before accepting a note or articulation: these are estimates.

04 / LISTEN AND CHECK

Let your ears guide you

You do not need to know every note: compare what you hear with what you see.

Play / Pause and Space

Play starts the original WAV and switches to pause. With the app window active, press Space to play or pause. Stop stops playback and returns to the beginning.

Select a note and use Play note

Select a table row or a note on the waveform/map. Play note includes 100 ms of context on each side, within the file. Previous and Next select and play the adjacent note, without wrapping at the ends.

Zoom and navigation

Waveform and map share zoom, scrolling, selection and cursor. Use the wheel or slider; Fit note focuses the selection and Full clip shows the recording. Both views resize together on maximize/restore. Click to seek.

Original audio / Synth

Choose Synth to hear detected notes with one simple local sound. Switching preserves playback position and state; only one source plays. Probable bends are included, not every pitch/vibrato detail. Preparation is local and cancellable.

The map is not an editor

Synth and MIDI use detected notes; they do not correct the analysis. Notes and boundaries cannot yet be edited. Report the timestamp of missing repeats, legato or jumps. Your WAV is unchanged.

05 / MIDI

Bring the phrase to your DAW

Save or drag detected notes. MIDI keeps actual timings; it does not quantize your performance.

Export MIDI

With Use range off, Export MIDI saves all notes. Drag MIDI to DAW delivers the same result to a DAW track. Cancelling the save dialog or drag does not change the analysis.

Use range: one phrase

Enable Use range and enter Start (s) and End (s), or use Set in and Set out at the cursor. Waveform and map highlight the range. Listen with Play range. Both saving and dragging export that fragment.

Fragment boundaries and origin

Notes crossing the start or end are clipped. The range starts at 0 seconds, preserving rests and relative timing. An invalid or empty range does not produce a useful MIDI file and shows a message.

Important: technical tempo of 60 BPM

Export declares 60 BPM and 960 PPQ to convert seconds into ticks. Honor this tempo on import; replacing it changes timing. It is not your song tempo or a configurable grid. In REAPER, test in a 60 BPM project.

Bends and dragged files

Probable bends use pitch bend with a ±12-semitone range; the receiving instrument must honor it or use the same setting. Note velocity is 100. Save or copy media into the DAW project before cleaning the staged export folder.

06 / TROUBLESHOOTING AND FEEDBACK

Tell us what happened

A specific description is more useful than a general rating. You do not need to attach audio.

The file will not open or analysis fails

Check the format and duration. If portable files are missing, extract the entire ZIP again. For the installed version, close the app and run setup again. Copy the exact error and state whether you used portable or installer.

Analysis seems slow

Record the first run time and a repeat with the same file without closing the app. Processing time depends on the audio and computer; the first run may take longer. Include CPU, RAM and Windows version if known.

Notes or bends do not match

Tell us which audio you used, the approximate time, what you hear and what the map shows. Detection is imperfect: weak notes, repetitions and note endings may need review.

After your test

Use the button on this page to send feedback. State version 0.3.3; if it is not listed, choose Other and enter it. In your comments, say whether you used portable or installer, what worked and what you would change.

Do not send other people's recordings or personal information in screenshots. Sharing audio is optional and must be agreed separately. The app does not automatically upload your WAV files.

Open the feedback form

The form is in Spanish. Click the button to open it.

Thank you for helping shape FIRULET MAP.
